

Operating Instructions - SSTCT1

Suitable for the tensioning and cutting of SWA range of stainless steel cables

The cable tie gun is intended for use on stainless steel ties only.

1. Fasten the tie by feeding the tail through the buckle, and securing, if appropriate. (Roller-ball ties automatically secure once the tail is fed through the buckle)
2. The tail of the tie is to be fed through the head of the tool from the front as indicated in the illustration above. Press handles together and continue to do so until the tie is fully tensioned.
3. To cut the tail of the tie, push the lever upwards fully – thus leaving the tail of the tie flush with the buckle.

SWA cannot accept liability for faults or injuries through misuse of the tool.
